CSCs have two alignment pins, equidistant from center

Real positions of these pins measured by photogrammetry

Goal: translate, rotate chamber to match measured

measured positions

ideal positions

Analytic solution: we apply only one motion to the Alignable

Rotation around y is unconstrained, so we don't touch ϕ_y

Goal: translate, rotate chamber to match measured

measured positions

ideal positions

Analytic solution: we apply only one motion to the Alignable

Rotation around y is unconstrained, so we don't touch ϕ_y

Goal: translate, rotate chamber to match measured

stretch factor
(unphysical)

Measurement error can stretch a chamber. Stretch is included in formal solution but not applied to Alignable.

Calculation in detail

Inputs: $\vec{P}_1^{\text{global}}$ and $\vec{P}_2^{\text{global}}$

Calculation in detail

correction applied in the local frame

Inputs: $\vec{P}_1^{\text{global}}$ and $\vec{P}_2^{\text{global}}$

Convert $\vec{P}_1^{\text{global}}$ and $\vec{P}_2^{\text{global}}$ to local frame (Alignable::surface)

Displacement in local frame: \vec{P}_1, \vec{P}_2

$$\Delta x = \frac{P_{1x} + P_{2x}}{2} - \sin \phi_z \sin \phi_x b$$

$$\Delta y = \frac{P_{1y} + P_{2y}}{2} + \cos \phi_z \sin \phi_x b$$

$$\Delta z = \frac{P_{1z} + P_{2z}}{2} - \cos \phi_x b$$

$$\cos^2 \phi_z = \frac{\left(\frac{P_{1y} - P_{2y}}{2a} \right)^2}{\left(\frac{P_{1x} - P_{2x}}{2a} \right)^2 + \left(\frac{P_{1y} - P_{2y}}{2a} \right)^2}$$

$$\cos^2 \phi_x = \frac{\left(\frac{P_{1x} - P_{2x}}{2a} \right)^2 + \left(\frac{P_{1y} - P_{2y}}{2a} \right)^2}{\left(\frac{P_{1x} - P_{2x}}{2a} \right)^2 + \left(\frac{P_{1y} - P_{2y}}{2a} \right)^2 + \left(\frac{P_{1z} - P_{2z}}{2a} \right)^2}$$

Built-in sanity check

remember the pin position in global coordinates

Built-in sanity check

now it should match local expected position

(This is a tautology.)

Two ways of measuring error

$(\text{stretch factor} - 1) \times \text{length}$
 \rightarrow error in survey constraints

$|\text{mismatch of global point}|$
 \rightarrow error in our computation
